

SENTRY

Protection against virus and hackers

Sentry is a family of data security devices that allows a Personal Computer (PC) to connect to two or more networks while maintaining electrical separation between the networks. Electrical separation provides one of the strongest means of protection against a virus or hacker on one network from gaining access to the other networks.

While the Internet has become an important part in our lives, one of the downside of the Internet is the threat of virus and hackers' attacks on corporate and individual Internet users.

Although anti-virus solutions are readily available to protect computer against viruses, they are effective only against known virus. As most of these anti-virus solutions are software-based, malicious codes are able to bypass these to escape detection and take their effect on the computer's system.

Sentry is the best product available to counteract virus and hackers' attacks as it provides physical isolation between the users' existing data and any downloaded data from the Internet or other LANS.

Sentry allows a user to work on different hard disks on a single PC. With this real physical isolation between stored data and downloaded data on two separate hard disks, there is no way that a virus accidentally downloaded from the Internet is able to gain access to the other hard disk containing sensitive data and take its toll on data stored there.

Three editions of the **Sentry** are available:

- i. **Sentry Enterprise Edition** supports connections to two LANs by splitting a PC into two virtual PCs with one on each LAN.

- ii. **Sentry Office Edition** allows connection to a LAN and the Internet.

- iii. **Sentry Home Edition** splits a PC into two virtual PCs, one for connections to the Internet and the other as a stand-alone PC.

Sentry consists of an external unit connected to an add-on card in the PC. When installed in a PC, the PC acquires two modes of operation. In each mode, it connects to one of the LAN for the Enterprise setup or Internet for the Office setup or operates as a standalone PC for the Home setup. The user selects the mode he requires through a pushbutton switch on the external unit.

Sentry is the best protection for confidential data on the computer.
